

Here's a project for you: Define, quantify and document your company's specific operational requirements and constraints as they relate to Supply Chain Management.

Include inbound and outbound product movement, warehousing, order processing, internal information flow, and asset management.

No Stone Unturned

Be sure to analyze all areas that impact or are impacted by the movement of product:

- Manufacturing
- Accounting
- Purchasing
- Warehousing
- Shipping
- Customer Service
- Sales
- Finance
- MIS
- Legal
- Planning

Want a Hand With That?

The Banfield Group's Operational Requirements Assessment pinpoints specific transportation-related requirements and expectations in each area of the business.

It can help you optimize each department's supply chain activities without compromising another department's performance in the process.

Our research method consists of three elements:

1. Detailed interviews and meetings at your facility, with staff members from each business function;
2. Supporting materials you provide, which we review and analyze off-site;
3. Review and incorporation of the Traffic Audit results compiled earlier.

All communicated requirements, processes and constraints are identified and documented in the Report of Findings - for each department, and for the whole enterprise.

The suggestions and recommendations relate to each department's participation in the overall supply chain process.

A Powerful Tool

Use it as a strategic planning tool:

- ✓ Define and monitor logistics throughout the company supply chain, recognizing company-wide constraints and requirements;
- ✓ Help select and manage carriers and other resources; and
- ✓ Achieve optimum effectiveness and profitability, related in both hard dollars and soft dollars.

The Needs Assessment gives you an eagle's-eye view. You get department-specific details, reported from a company perspective.
